Curriculum Framework  
Math Grade 6

Fruit Preference	# of students
banana	6
apple	7
pear	3
strawberry	4

Fruit Preferences in Mrs. Jones' Class

- Circle graphs can represent percent or frequency.
- Circle graphs are not useful for representing data with large numbers of categories.

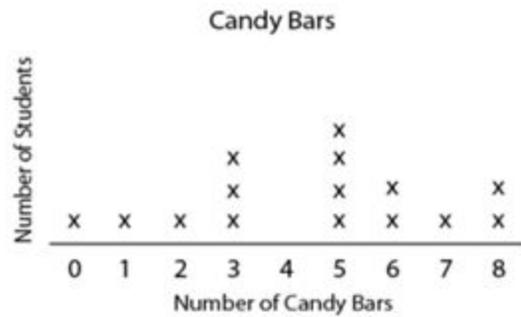

**Richmond Public Schools**  
Curriculum Framework  
*Math Grade 6*

- Teachers should be reasonable about the selection of data values. The number of data values can affect how a circle graph is constructed (e.g., 10 out of 25 would be 40%, but 7 out of 9 would be 77.7%, making the construction of a circle graph more complex). Students should have experience constructing circle graphs, but a focus should be placed on the analysis of circle graphs.
- Students are not expected to construct circle graphs by multiplying the percentage of data in a category by  $360^\circ$  in order to determine the central angle measure. Limiting comparisons to fraction parameters noted will assist students in constructing circle graphs.
- To collect data for any problem situation, an experiment can be designed, a survey can be conducted, or other data-gathering strategies can be used. The data can be organized, displayed, analyzed, and interpreted to solve the problem.
- Categorical data can be sorted into groups or categories while numerical data are values or observations that can be measured. For example, types of fish caught would be categorical data while weights of fish caught would be numerical data.
- Different types of graphs can be used to display categorical data. The way data are displayed often depends on what someone is trying to communicate.
  - A line plot is used for categorical and discrete numerical data and is used to show frequency of data on a number line. It is a simple way to organize data.  
Example:

# Richmond Public Schools

## Curriculum Framework

### Math Grade 6

- A bar graph is used for categorical and discrete numerical data (e.g., number of months or number of people with a particular eye color) and is used to show comparisons.
- A pictograph is mainly used to show categorical data. Pictographs are used to show frequency and compare items. However, the use of partial pictures can give misleading information.
  - Example:

**The Types of Pets We Have**

Cat	Dog	Horse	Fish
☺	☺ ☺ ☺ ☺	☺	☺ ☺ ☺

☺ = 1 student

<b>Cross-Curricular Connections</b>	<b>Tiered Differentiations</b>
<p>As part of the Scientific Method taught in science class, students are required to record and analyze the data of their experiments. Here graphs can be created to display data and determine if the stated hypothesis is correct or incorrect.</p>	<p>To meet the needs of all learner the following manipulatives can be used throughout the unit: square tile, centimeter cubes, two color counters, transparent counters, grid paper, and newspaper/internet articles with data.</p> <p>A quick review of pictographs, bar graphs, line plots, stem and leaf and frequency tables is beneficial when starting this unit. Have several of each type of graph around the room. Have students walk around and write everything they remember about that graph. The more relevant the data, the more the students will be engaged.</p>
